DSI 321 Capstone

DNA Methylation Signature Analysis

Marva L.

Outline

01

Introduction **The Dataset**

DNA methylation signature;
TCGA project

03

Sanity Check

Unsupervised Learning

tSNE

02

Modeling

Supervised Learning

Decision Tree &
Random Forest

04

Conclusion &

Recommendations

01

Introduction **The Dataset**

cytosine

methylated
cytosine

https://en.wikipedia.org/wiki/DNA_methylation

DNA Methylation Signature & Cancer

The TCGA project

<https://www.cancer.gov/about-nci/organization/ccq/research/structural-genomics/tcga>

https://en.wikipedia.org/wiki/DNA_methylation

The Dataset Challenges

- Imbalanced data
- Over 420k features
 - Subset of 9,000 features (2%)

02

Supervised Learning

Decision Tree & Ensembles

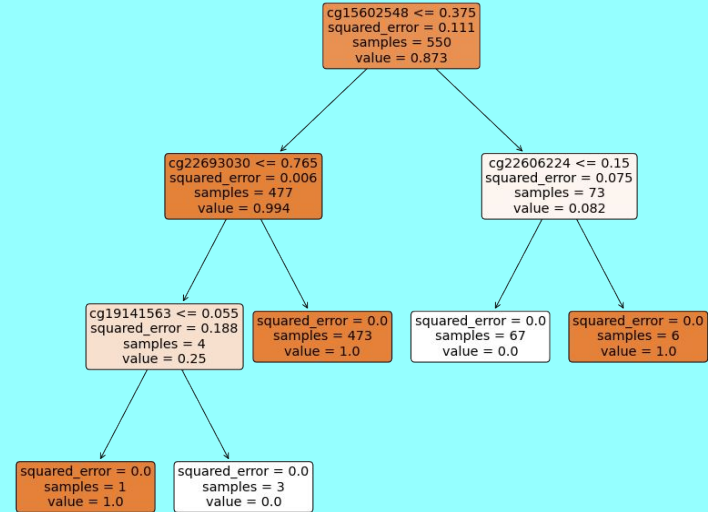

First Model

A Decision Tree

Train 1.0

Test 0.47

Classification of Samples: Benign/Malignant

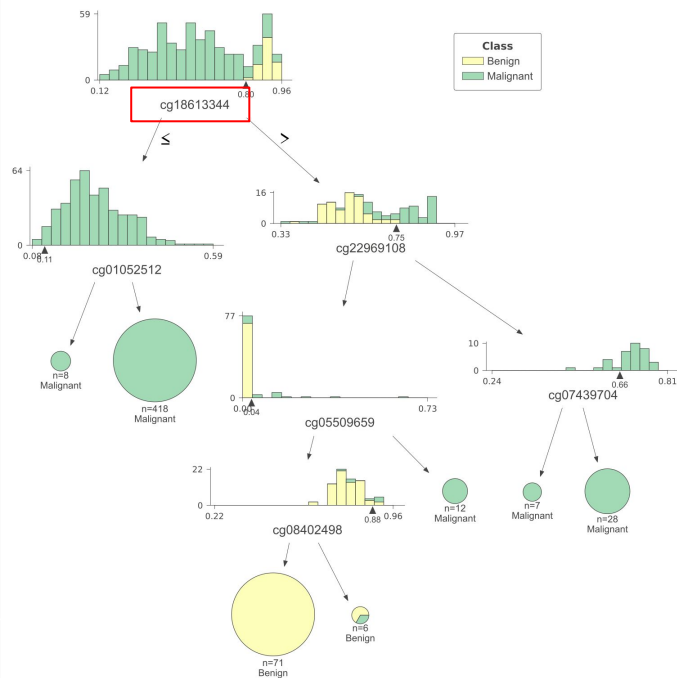

Second Model

Random Forest

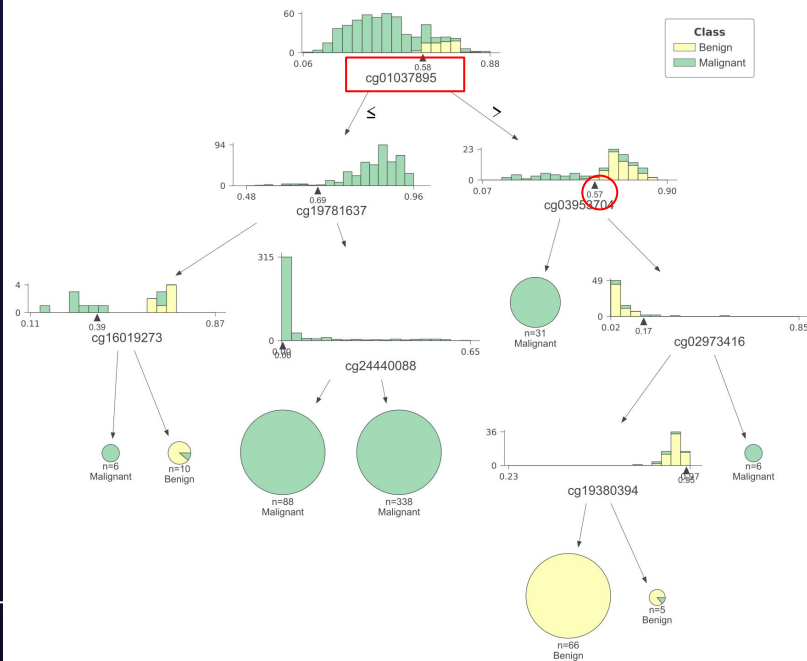

Train 0.998

Test 0.983

Random Forest Classifier, Estimator #34

Random Forest Classifier, Estimator #89

Random Forest

Confusion Matrix

03

Unsupervised Learning **tSNE**

T-distributed Stochastic
Neighbor Embedding

Tissue Samples Distribution Visualized with tSNE

Based on the 2% of DNA sites with the greatest variance in methylation signatures

04

Conclusions & Recommendations

Conclusions & Recommendations

- DNA methylation signature can be utilized to detect malignant tumors
 - Researched & used in both academy and industry
 - Future steps:
 - Features importance
 - Interpreting the tSNE outcomes
-
